Subject: Tier II and III sampling
Date: Monday, January 14, 2013 11:34:19 AM

All,

Some time ago I distributed an interactive Google Doc regarding Tier II and Tier III sampling frequency (ideal, and minimum needed for modeling purposes), time frame to sample, how many sites to sample, etc. I am especially concerned with minimum sampling frequency, as I am not familiar with what is needed by the modelling folks. This will help us site managers to keep on schedule and make sure we are completing all of our tasks.

If your name is listed at the top of one of our Tier II or Tier III protocols (CO2 efflux, IPAR, LAI, carbon protocol, wood cores), please see the link below and fill on the missing fields (highlighted in yellow). If multiple parties have contributed to a protocol, and you yourself are not confident about what to fill in one of the missing fields, you can leave your initials and wait to see what other protocol contributors have to say.

Please visit the link below and take the 2 minutes to fill in some missing info. Also, if anything on there looks wrong, please leave a note.
